

-
- Transverse momentum p_T : momentum transverse to the beam axis.
 - Transverse Energy E_T : Energy transverse to beam axis, deposited in calorimeter.
 - Classical Scattering
 - Quantization
 - Scalar Fields
 - On-shell
 - Branching Ratio: The fraction of particles that decay via a particular decay mode.
 - Cross Section: A measure of the probability that a specific process will occur when particles collide. It is typically measured in units of area, such as barns ($1 \text{ barn} = 10^{-28} \text{m}^2 = 10^{-24} \text{cm}^2$).
 - Luminosity: A measure of the number of particles per unit area per unit time in a collider. It is used to calculate the event rate for a given process.
 - Integrated Luminosity: The total luminosity accumulated over a specific period of time. It is often expressed in inverse femtobarns (fb^{-1}).
 - Event Topologies:
